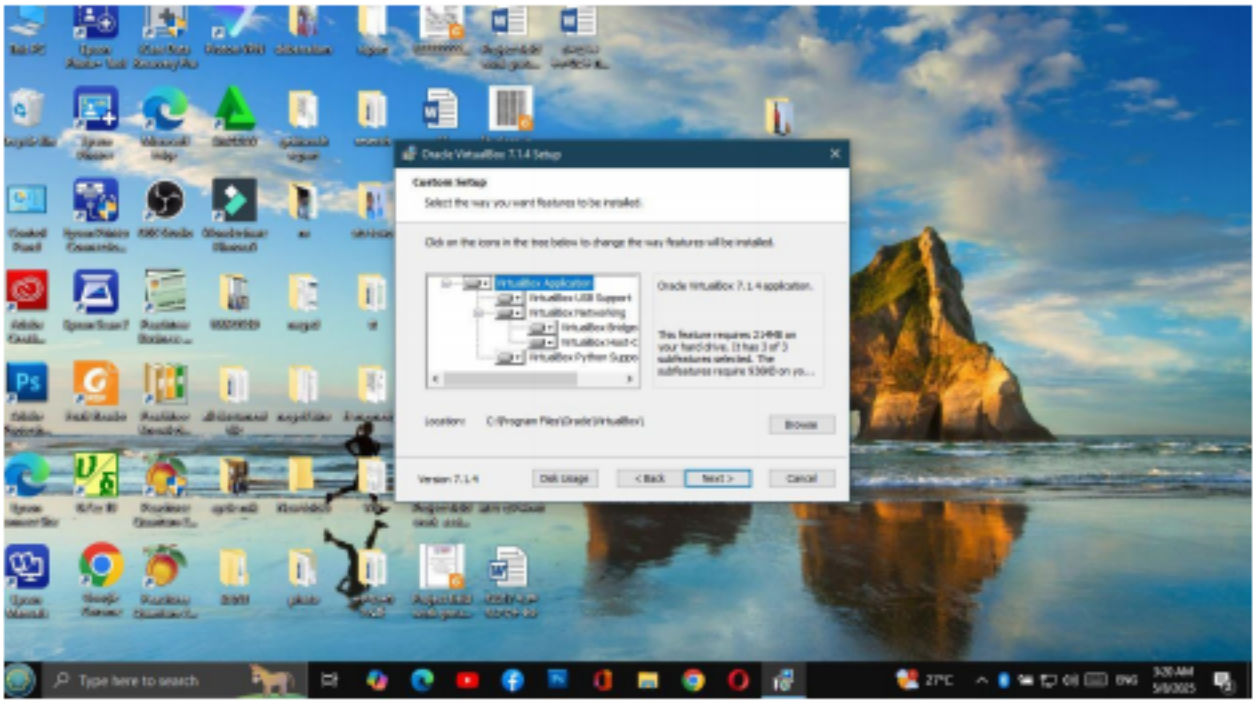
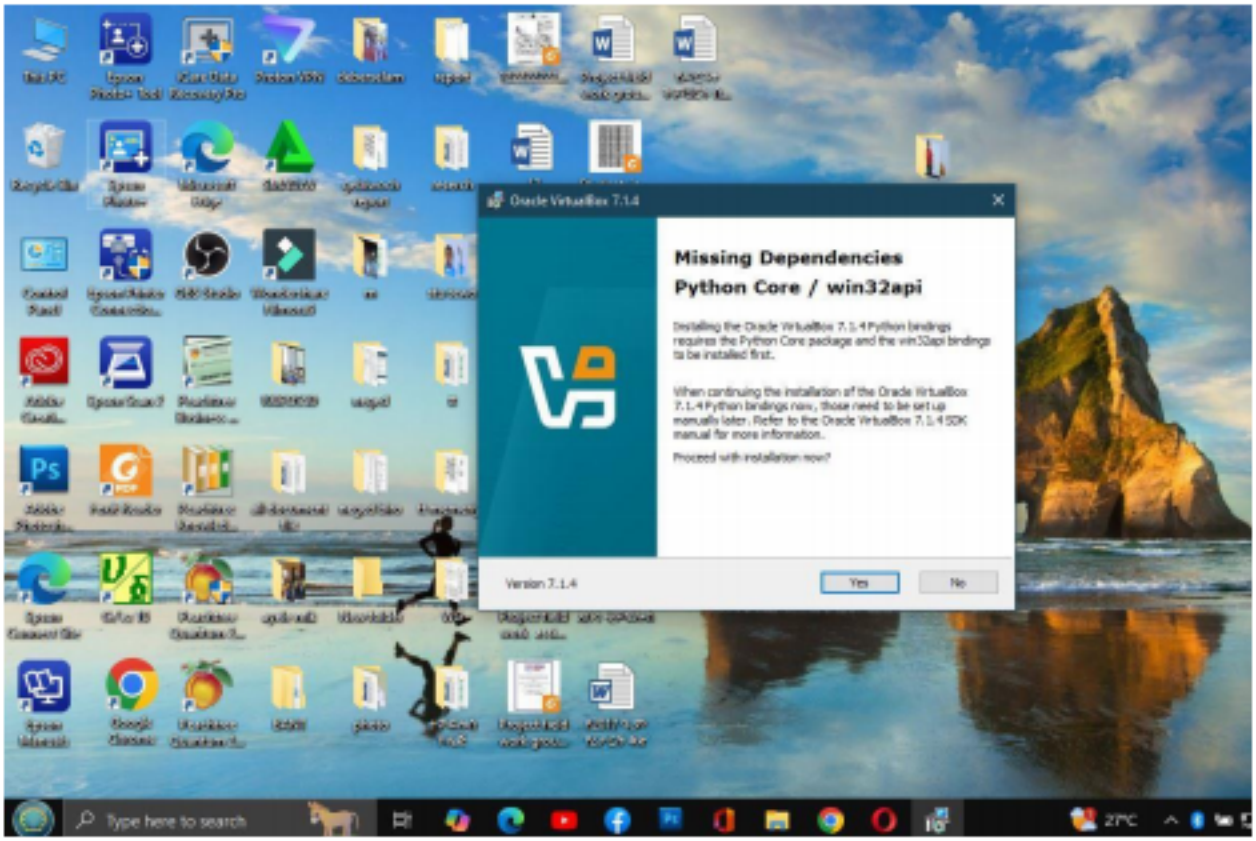
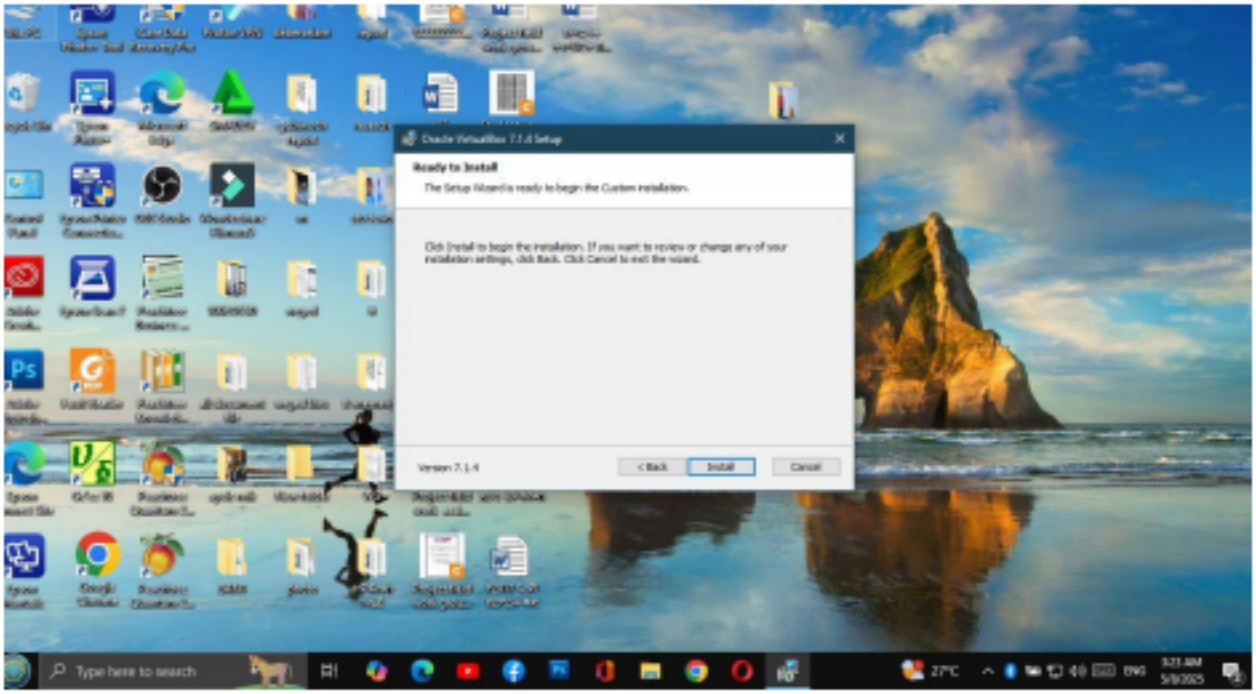
Step 2: we don’t have to change anything so choose next.

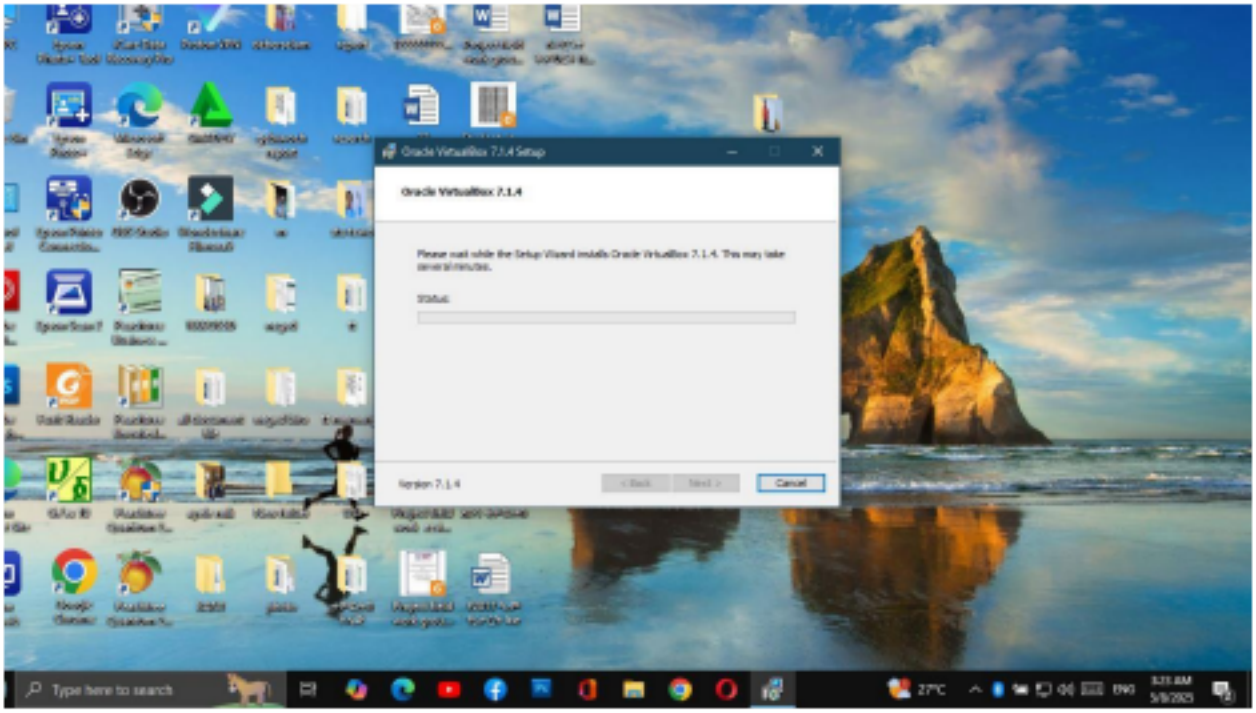


Step 3: the same process we will select yes now .

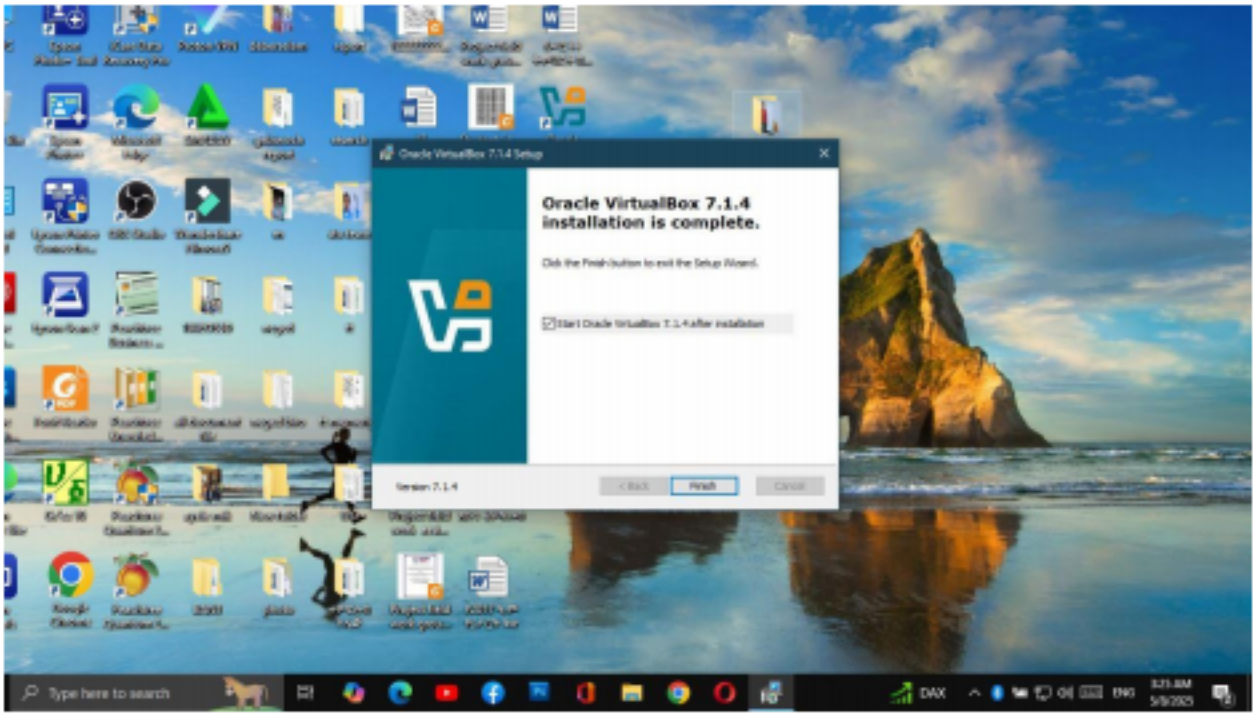


Step 4: now, we have done these steps so we will click install to begin the installation process. if we want to make any changes we can click back otherwise click install.

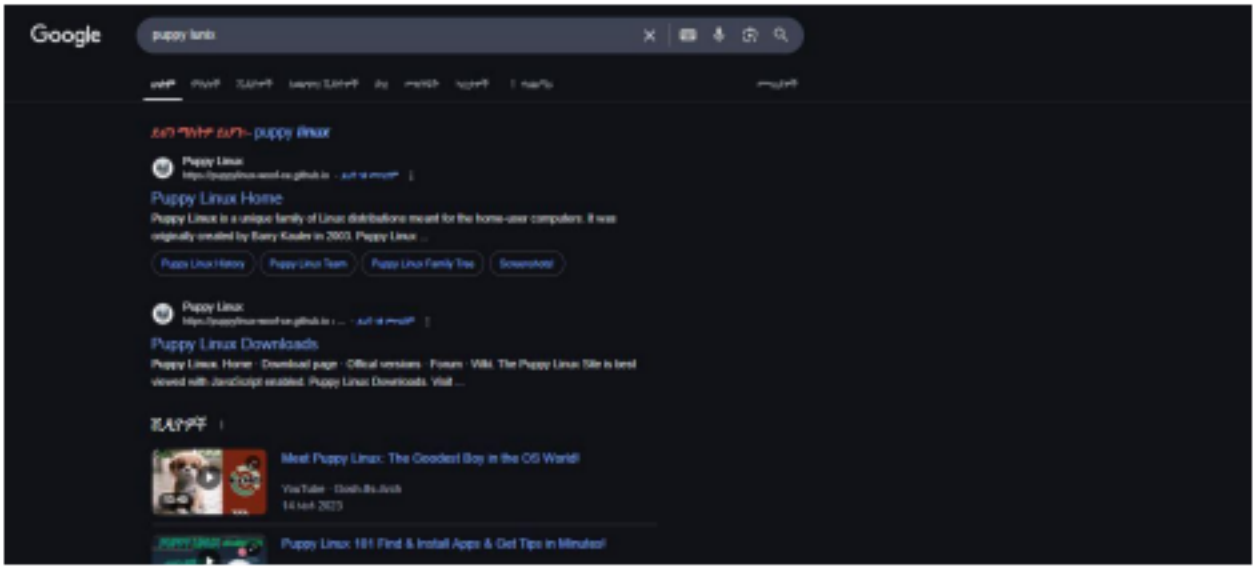




Step 5: now we finished installing so click finish and go to the next step.

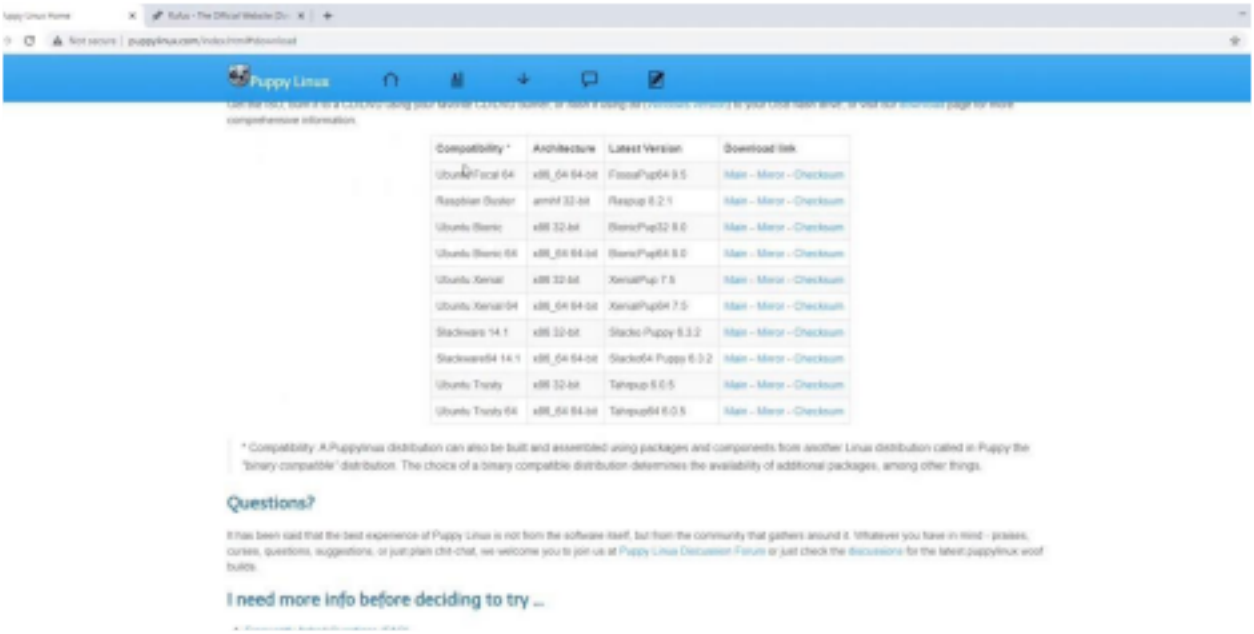


Step 6: now that we install the virtual box the next will be installing ISO file of puppy lunix by going in puppy lunix official website

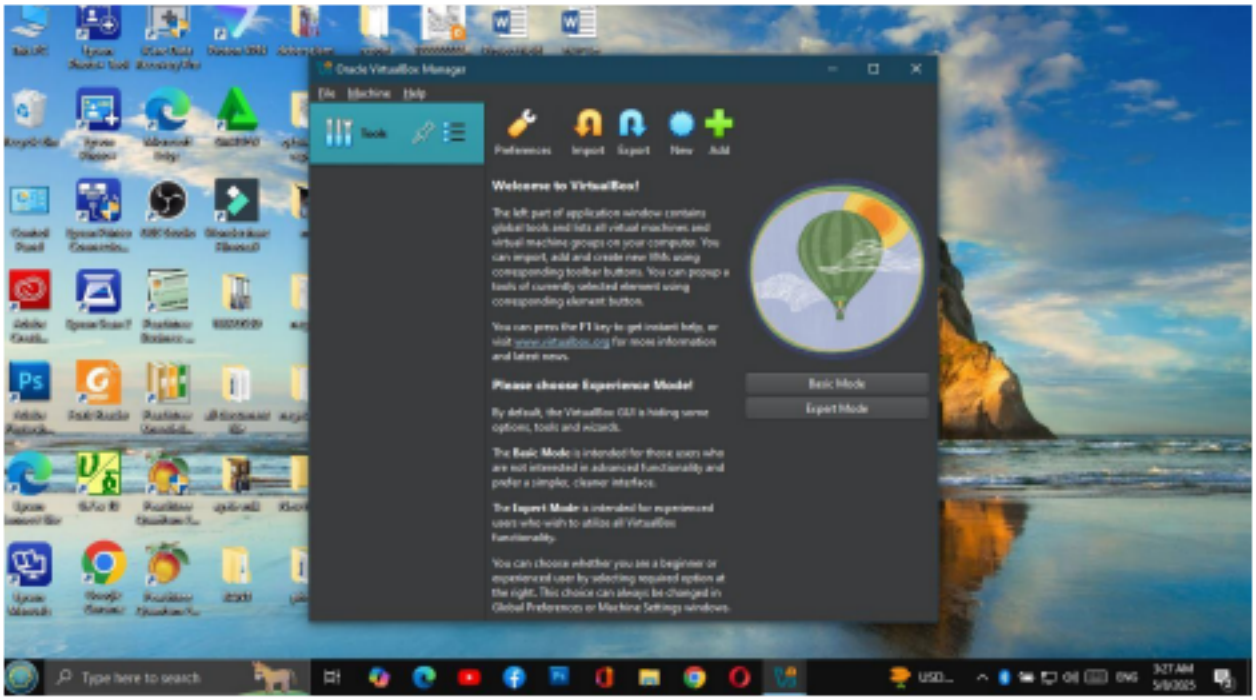


Step 7 :click the home page then we get the website for puppy lunix

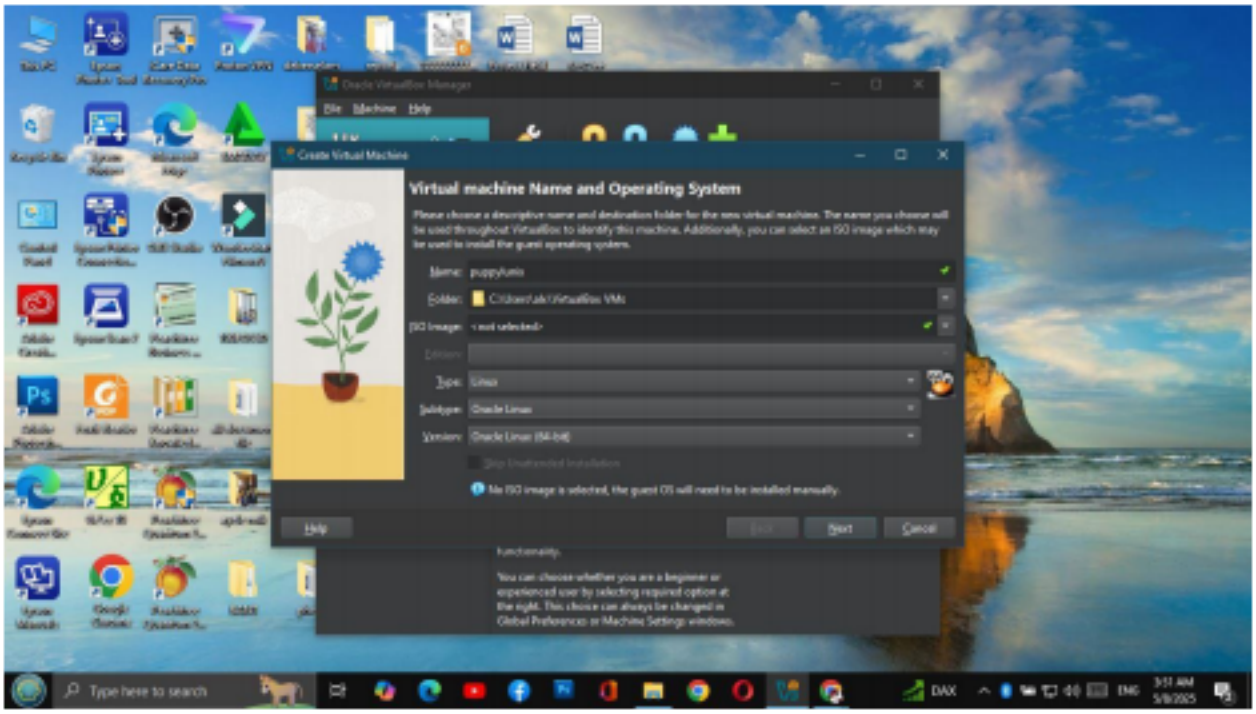
Step 8.chooes a version of ISO file of puppy Lunix.



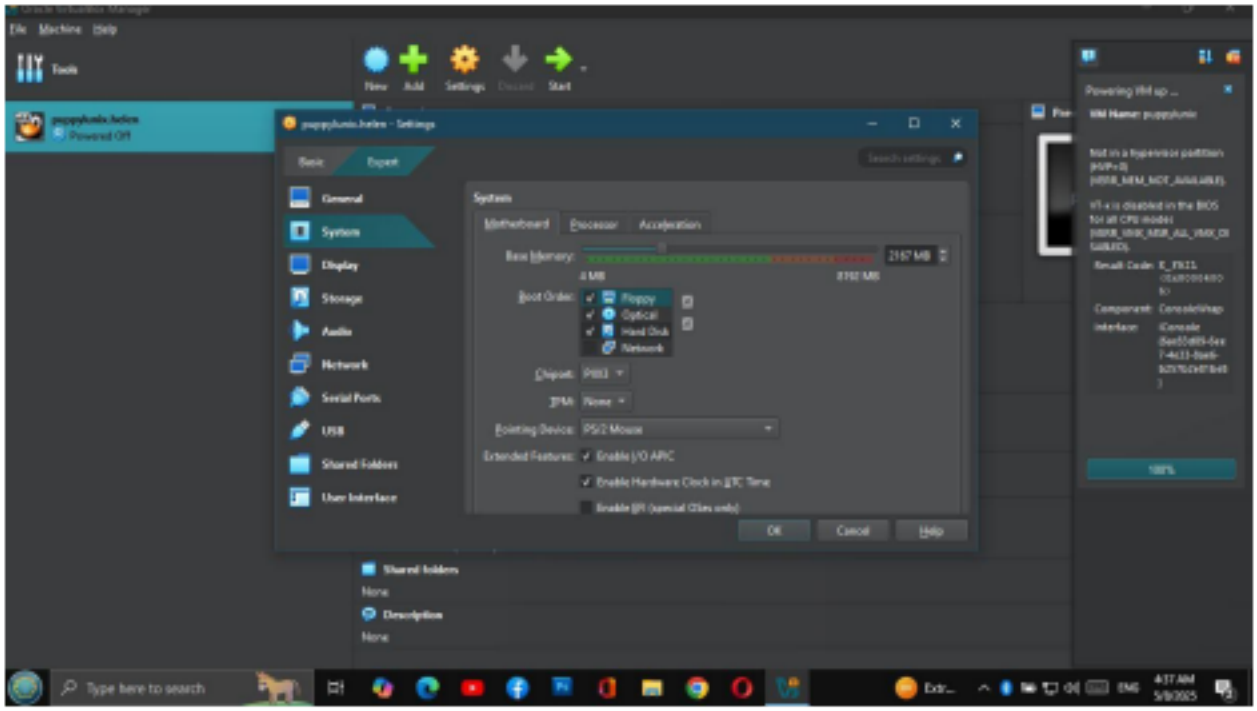
Step 9:now , we have downloaded the ISO file so we go back to virtualbox ad create a new virtual machine .



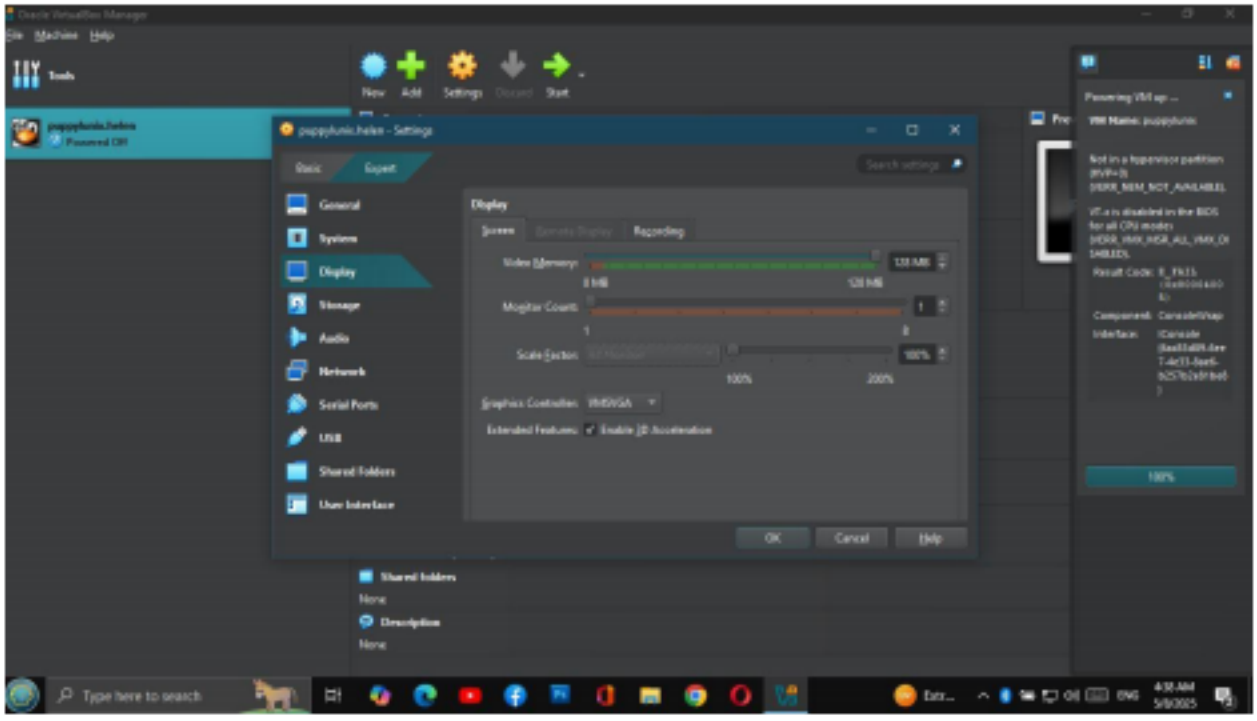
Step 10:now lets name our OS puppy lunix attach the ISO file , type ,version and click next .



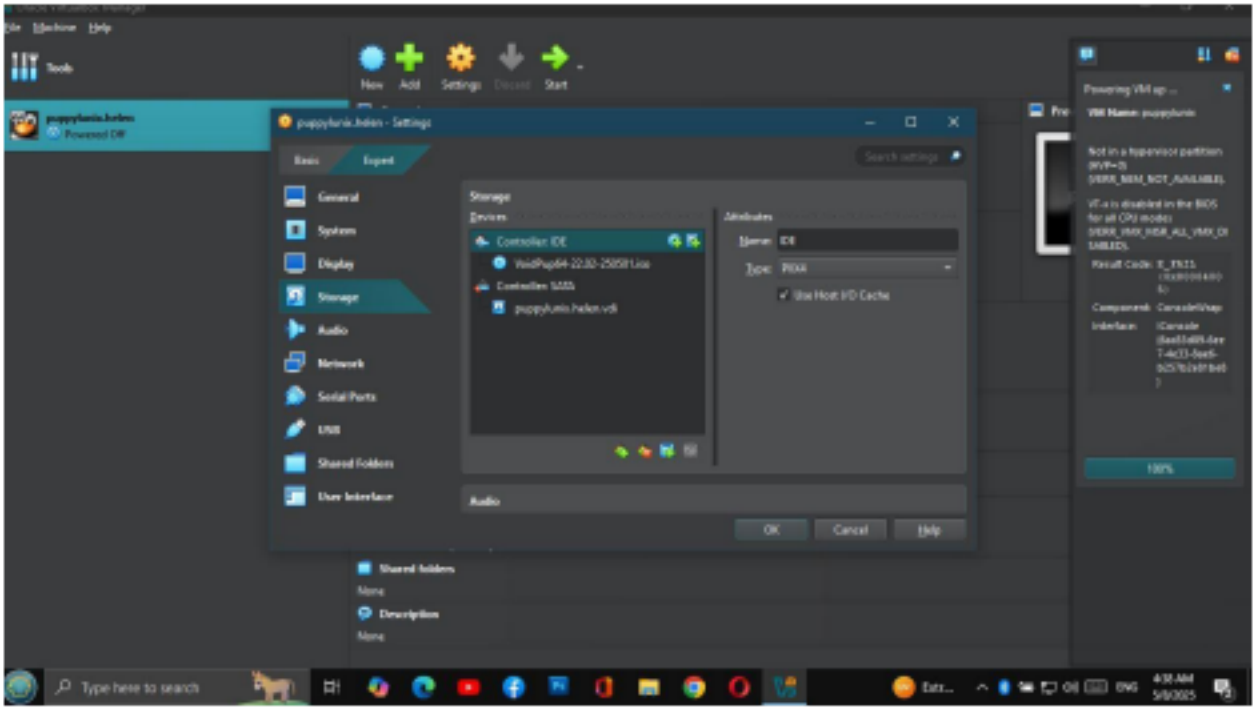
Step 11: go to the system and change the base memory we shouldn't allocate more than 40 percent of our RAM of our PC because it will slow down the process.



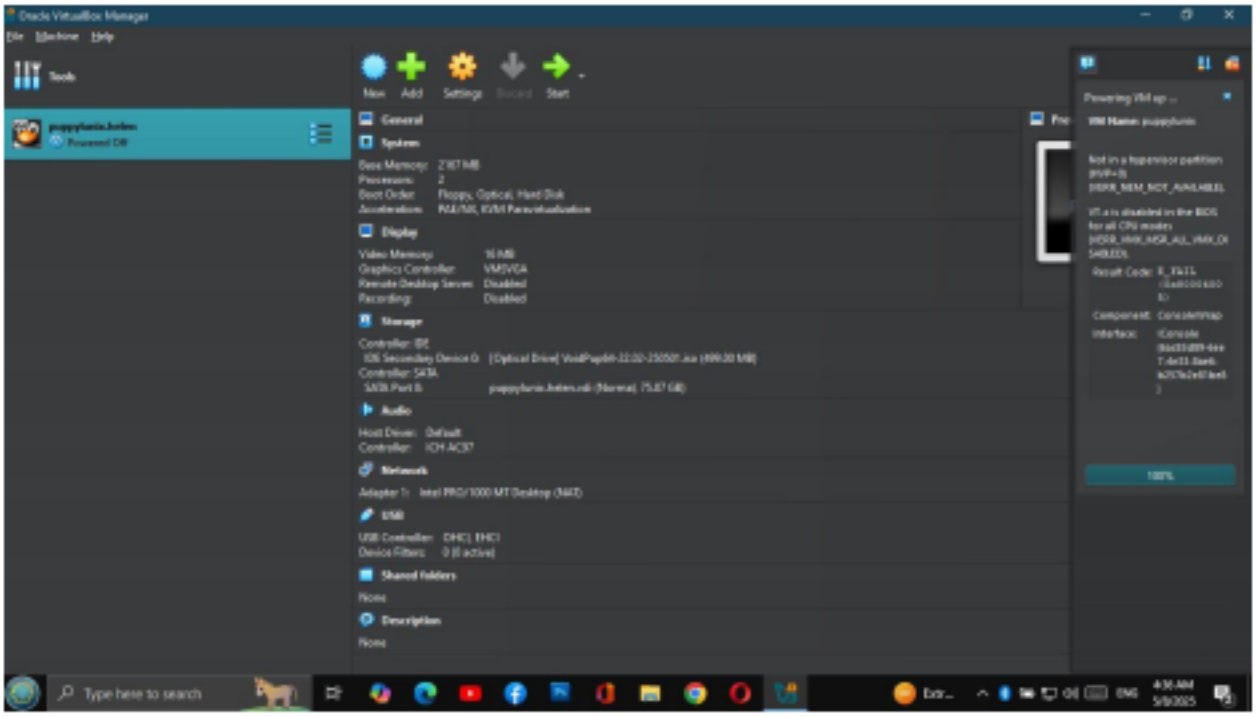
Step 12:go to display and make the video memory 128MB.



Step 13: now go to storage and click on controller IDE and insert the ISO file and click ok.



Step 14: finally ,we created our virtual machine named Puppylunix.helen.



Step 15: the last step is click start and start our machine and if we have any modifications we can make it ,once we have done installing puppy lunix we can install the VirtualBox Guest additions for better integration with host and guest operating systems.

Issues faced

The main problem I have been facing with was network (internet connection) the whole time .

solution

The solution I take was using different network options ,changing the source network, places and also hardware.
